Lecture 1

Graphs

- ☒ Extremely useful tool in modeling problems
- ☒ Consist of:

- Vertices

Evaluation only.

Created with Aspose.Slides for .NET Standard 2.0-23.1.

- Edges

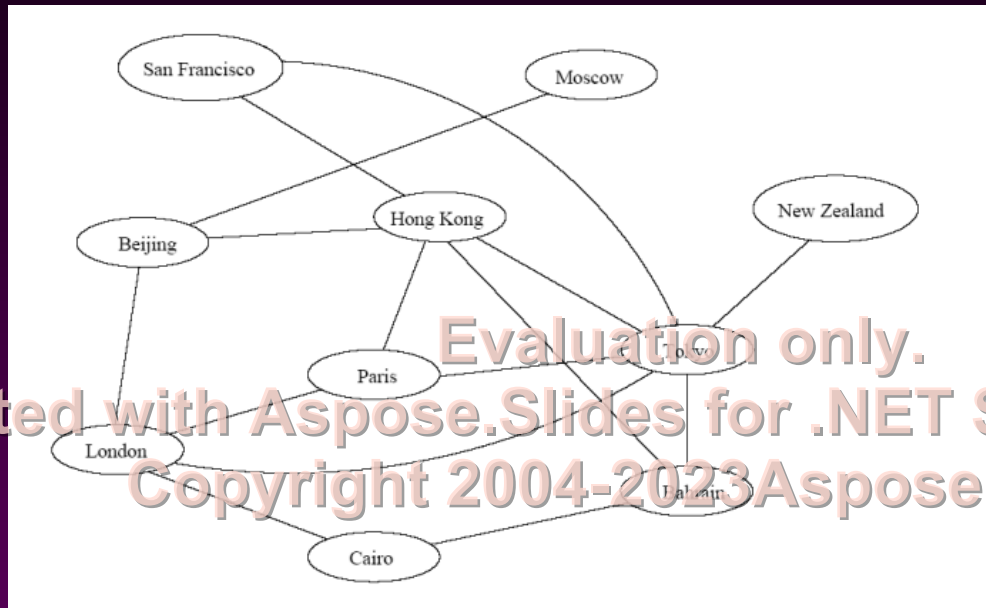

Copyright 2004-2023 Aspose Pty Ltd.

vertices can be considered “sites” or locations.

Edges represent connections.

Application

Air flight system

- Each vertex represents a city
- Each edge represents a direct flight between two cities
- A query on **direct flights** = a query on whether an edge exists
- A query on **how to get to a location** = does a **path** exist from A to B
- We can even associate costs to **edges** (**weighted graphs**), then ask “what is the cheapest path from A to B”

Definition

- ✉ A **graph** $G=(V, E)$ consists a set of **vertices**, V , and a set of **edges**, E .
- ✉ Each edge is a pair of (v, w) , where v, w belongs to V
- ✉ If the pair is unordered, the graph is **undirected**; otherwise it is **directed**.

Evaluation only.

Created with Aspose.Slides for .NET Standard 2.0 23.1.
Copyright 2004-2023 Aspose Pty Ltd.

$$V = \{a, b, c, d, e, f\}$$

$$E = \{\{a, b\}, \{a, c\}, \{b, d\}, \{c, d\}, \{b, e\}, \{c, f\}, \{e, f\}\}$$

An undirected graph

Definition

✉ Complete Graph

- How many edges are there in an N-vertex complete graph?

Evaluation only.

✉ Bipartite Graph

Created with Aspose.Slides for .NET Standard 2.0 23.1.

- What is its property? How can we detect it?

Copyright 2004-2023 Aspose Pty Ltd.

✉ Path

✉ Tour

✉ Degree of a vertices

- Indegree
- Outdegree
- Indegree+outdegree = Even (why??)

Graph Variations

✉ Variations:

- A *connected graph* has a path from every vertex to every other vertex.

Created with Aspose.Slides for .NET Standard 2.0 23.1.

- In an *undirected graph*:

Copyright 2004-2023 Aspose Pty Ltd.

- ✎ Edge $(u,v) = \text{edge } (v,u)$

- ✎ No self-loops

- In a *directed graph*:

- ✎ Edge (u,v) goes from vertex u to vertex v , notated $u \rightarrow v$

Graph Variations

✉ More variations:

- A *weighted graph* associates weights with either the edges or the vertices

✎ E.g., a road map: edges might be weighted w/ distance

- A *multigraph* allows multiple edges between the same vertices

✎ E.g., the call graph in a program (a function can get called from multiple points in another function)

Graphs

- ✉ We will typically express running times in terms of $|E|$ and $|V|$ (often dropping the $|$'s)

Evaluation only.

Created with Aspose.Slides for .NET Standard 2.0 23.1.

- If $|E| \approx |V|^2$ the graph is *dense*

Copyright 2004-2023 Aspose Pty Ltd.

- If $|E| \approx |V|$ the graph is *sparse*

- ✉ If you know you are dealing with dense or sparse graphs, different data structures may make sense

Graph Representation

- ✉ Two popular computer representations of a graph. Both represent the vertex set and the edge set, but in different ways.

Evaluation only!

Created with Aspose.Slides for .NET Standard 2.0 23.1.
Copyright 2004-2023Aspose Pty Ltd.

1. **Adjacency Matrix**

Use a 2D matrix to represent the graph

2. **Adjacency List**

Use a 1D array of linked lists

Adjacency Matrix

Created with Aspose.Slides for .NET Standard 2.0 23.1.
Copyright 2004-2023 Aspose Pty Ltd.

- ✉ 2D array $A[0..n-1, 0..n-1]$, where n is the number of vertices in the graph
- ✉ Each row and column is indexed by the vertex id
 - e.g a=0, b=1, c=2, d=3, e=4
- ✉ $A[i][j]=1$ if there is an edge connecting vertices i and j ; otherwise, $A[i][j]=0$
- ✉ The **storage** requirement is $\Theta(n^2)$. It is not efficient if the graph has few edges. An **adjacency matrix** is an **appropriate** representation if the graph is **dense**: $|E|=\Theta(|V|^2)$
- ✉ We can detect in $O(1)$ time whether two vertices are connected.

Simple Questions on Adjacency Matrix

- ✉ Is there a direct link between A and B?
- ✉ What is the indegree and outdegree for a vertex A? Evaluation only.

Created with Aspose Slides for .NET Standard 2.0 23.1.
Copyright 2004-2023 Aspose Pty Ltd.

- ✉ How many nodes are directly connected to vertex A?

- ✉ Is it an undirected graph or directed graph?
- ✉ Suppose ADJ is an $N \times N$ matrix. What will be the result if we create another matrix ADJ2 where $ADJ2 = ADJ \times ADJ$?

Adjacency List

- ✉ If the graph is not dense, in other words, **sparse**, a better solution is an adjacency list
- ✉ The adjacency list is **an array $A[0..n-1]$ of lists**, where n is the number of vertices in the graph.
- ✉ Each array entry is indexed by the vertex id
- ✉ Each **list $A[i]$** stores the **ids of the vertices adjacent to vertex i**

Adjacency Matrix Example

	0	1	2	3	4	5	6	7	8	9
0	0	0	0	0	0	0	0	0	1	0
1	0	0	1	1	0	0	0	1	0	1
2	0	1	0	0	0	0	0	0	0	0
3	0	0	0	0	1	0	0	0	0	0
4	0	0	1	1	0	0	0	0	0	0
5	0	0	0	1	0	0	1	0	0	0
6	0	0	0	0	0	1	0	1	0	0
7	0	1	0	0	0	0	0	1	0	0
8	1	0	1	0	0	0	0	0	0	1
9	0	1	0	0	0	0	0	0	1	0

Adjacency List Example

0	→	8
1	→	2 3 7 9
2	→	1 4 8
3	→	1 4 5
4	→	2 3
5	→	3 6
6	→	5 7
7	→	1 6
8	→	0 2 9
9	→	1 8

Evaluation only.

Created with Aspose.Slides for .NET Standard 2.0 23.1.
Copyright 2004-2023 Aspose Pty Ltd.

Storage of Adjacency List

- ✉ The array takes up $\Theta(n)$ space
- ✉ Define **degree** of v , $\deg(v)$, to be the number of edges incident to v . Then, the total space to store the graph is proportional to:

$$\sum_{\text{vertex } v} \deg(v)$$

Evaluation only.

Created with Aspose.Slides for .NET Standard 2.0 23.1.

- ✉ An edge $e = \{u, v\}$ of the graph contributes a count of 1 to $\deg(u)$ and contributes a count 1 to $\deg(v)$
- ✉ Therefore, $\sum_{\text{vertex } v} \deg(v) = 2m$, where m is the total number of edges
- ✉ In all, the **adjacency list takes up $\Theta(n+m)$ space**
 - If $m = O(n^2)$ (i.e. dense graphs), both adjacent matrix and adjacent lists use $\Theta(n^2)$ space.
 - If $m = O(n)$, adjacent list outperform adjacent matrix
- ✉ However, one cannot tell in $O(1)$ time whether two vertices are connected

Adjacency List vs. Matrix

✉ Adjacency List

- More compact than adjacency matrices if graph has few edges
- Requires more time to find if an edge exists

Evaluation only.

Created with Aspose.Slides for .NET Standard 2.0 23.1.
Copyright 2004-2023 Aspose Pty Ltd.

✉ Adjacency Matrix

- Always require n^2 space
 - 📁 This can waste a lot of space if the number of edges are sparse
- Can quickly find if an edge exists

Path between Vertices

✉ A **path** is a sequence of vertices ($v_0, v_1, v_2, \dots, v_k$) such that:

- For $0 \leq i < k$, $\{v_i, v_{i+1}\}$ is an edge

Evaluation only.

Created with Aspose Slides for .NET Standard 2.0 23.1.
Note: a path is allowed to go through the same vertex or the same edge any number of times!
Copyright 2004-2023 Aspose Pty Ltd.

✉ The **length** of a path is the number of edges on the path

Types of paths

- ✉ A path is **simple** if and only if it does not contain a vertex more than once

Evaluation only.

Created with Aspose.Slides for .NET Standard 2.0 23.1.

Copyright 2004-2023 Aspose Pty Ltd.

- ✉ A path is a **cycle** if and only if $v_0 = v_k$

📁 The beginning and end are the same vertex!

- ✉ A path contains a cycle as its sub-path if some vertex appears twice or more

Path Examples

Are these paths?

Any cycles?

What is the path's length?

Evaluation only.

Created with Aspose.Slides for .NET Standard 2.0 23.1.
Copyright 2004-2023 Aspose Pty Ltd.

1. {a,c,f,e}

2. {a,b,d,c,f,e}

3. {a, c, d, b, d, c, f, e}

4. {a,c,d,b,a}

5. {a,c,f,e,b,d,c,a}

Graph Traversal

✉ Application example

- Given a graph representation and a vertex s in the graph

Evaluation only.

Created with Aspose from Slides for the NET Standard 2.0 23.1.

Copyright 2004-2023 Aspose Pty Ltd.

✉ Two common graph traversal algorithms

📁 Breadth-First Search (BFS)

- Find the shortest paths in an unweighted graph

📁 Depth-First Search (DFS)

- Topological sort
- Find strongly connected components

BFS and Shortest Path Problem

- ✉ Given any source vertex s , BFS visits the other vertices at **increasing distances** away from s . In doing so, BFS discovers paths from s to other vertices
- ✉ What do we mean by **distance**? The **number of edges on a path from s**

Example

Consider s =vertex 1

Nodes at distance 1?

2, 3, 7, 9

Nodes at distance 2?

8, 6, 5, 4

Nodes at distance 3?

0

Graph Searching

✉ Given: a graph $G = (V, E)$, directed or undirected

✉ Goal: methodically explore every vertex and every edge

Evaluation only.
Created with Aspose.Slides for .NET Standard 2.0 23.1.
Copyright 2004-2023 Aspose Pty Ltd.

✉ Ultimately: build a tree on the graph

- Pick a vertex as the root
- Choose certain edges to produce a tree
- Note: might also build a *forest* if graph is not connected

Breadth-First Search

✉ “Explore” a graph, turning it into a **tree**

- One vertex at a time

- Expand frontier of explored vertices across

the *breadth* of the frontier

Created with Aspose Slides for .NET Standard 2.0 23.1.
Copyright 2004-2023 Aspose Pty Ltd.

✉ Builds a tree over the graph

- Pick a *source vertex* to be the root

- Find (“discover”) its children, then their children, etc.

Breadth-First Search

✉ Every vertex of a graph contains a color at every moment:

- **White vertices** have not been discovered

✉ All vertices start with white initially

- **Grey vertices** are discovered but not fully explored

✉ They may be adjacent to white vertices

- **Black vertices** are discovered and fully explored

✉ They are adjacent only to black and gray vertices

✉ Explore vertices by scanning adjacency list of grey vertices

Breadth-First Search: The Code

Data: color[V], prev[V], d[V]

BFS(G) // starts from here

```
{
  for each vertex u ∈ V - {s}
  {
    color[u] = WHITE;
    prev[u] = NIL;
    d[u] = inf;
  }
  color[s] = GRAY;
  d[s] = 0; prev[s] = NIL;
  Q = empty;
  ENQUEUE(Q, s);
```

```
  While(Q not empty)
  {
    u = DEQUEUE(Q);
    for each v ∈ adj[u] {
      if (color[v] ==
        WHITE) {
        color[v] = GRAY;
        d[v] = d[u] + 1;
        prev[v] = u;
        Enqueue(Q, v);
      }
    }
    color[u] = BLACK;
  }
}
```

Breadth-First Search: Example

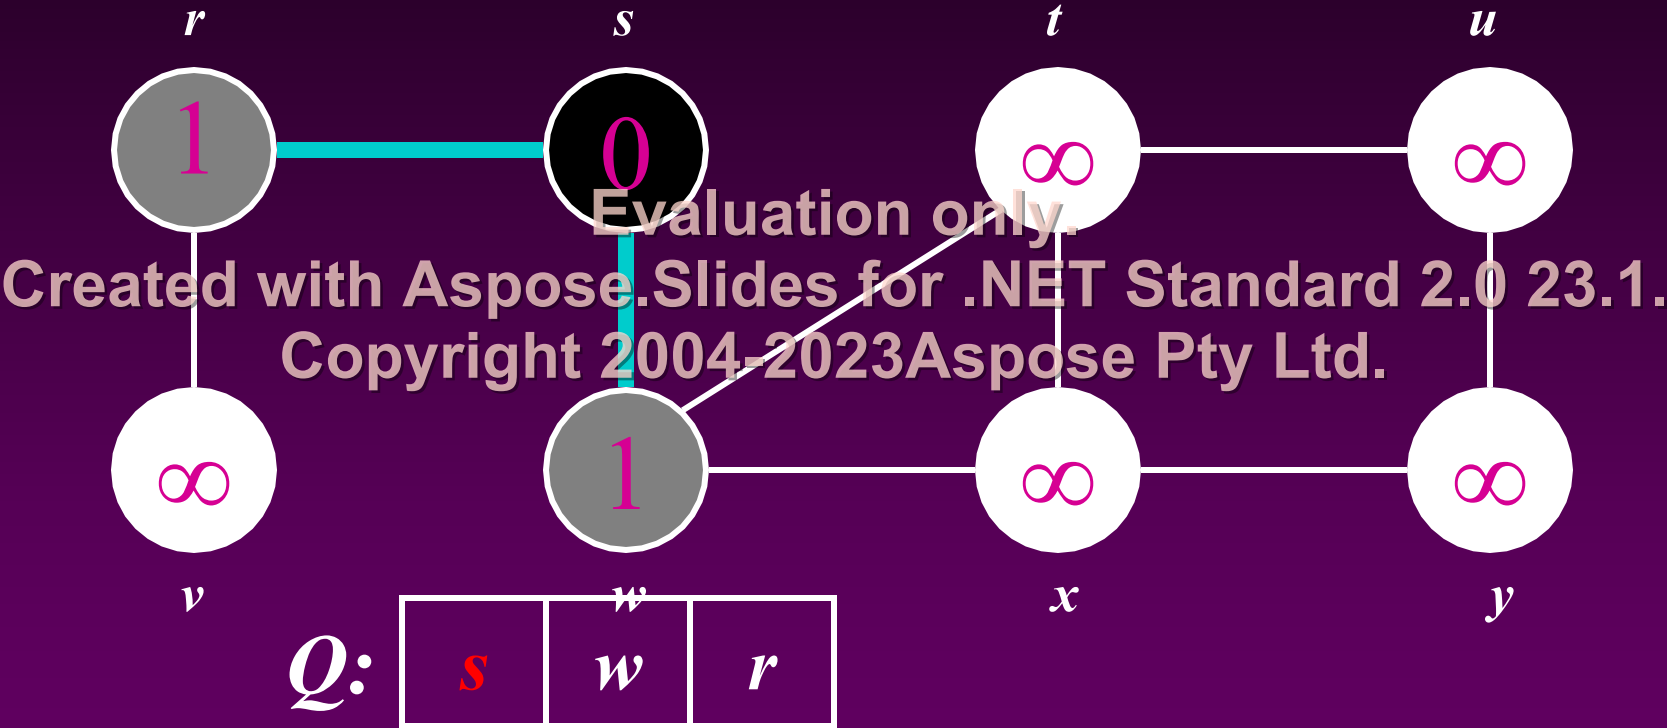

Vertex	r	s	t	u	v	w	x	y
color	W	W	W	W	W	W	W	W
d	∞	∞	∞	∞	∞	∞	∞	∞
prev	nil	nil	nil	nil	nil	nil	nil	nil

Breadth-First Search: Example

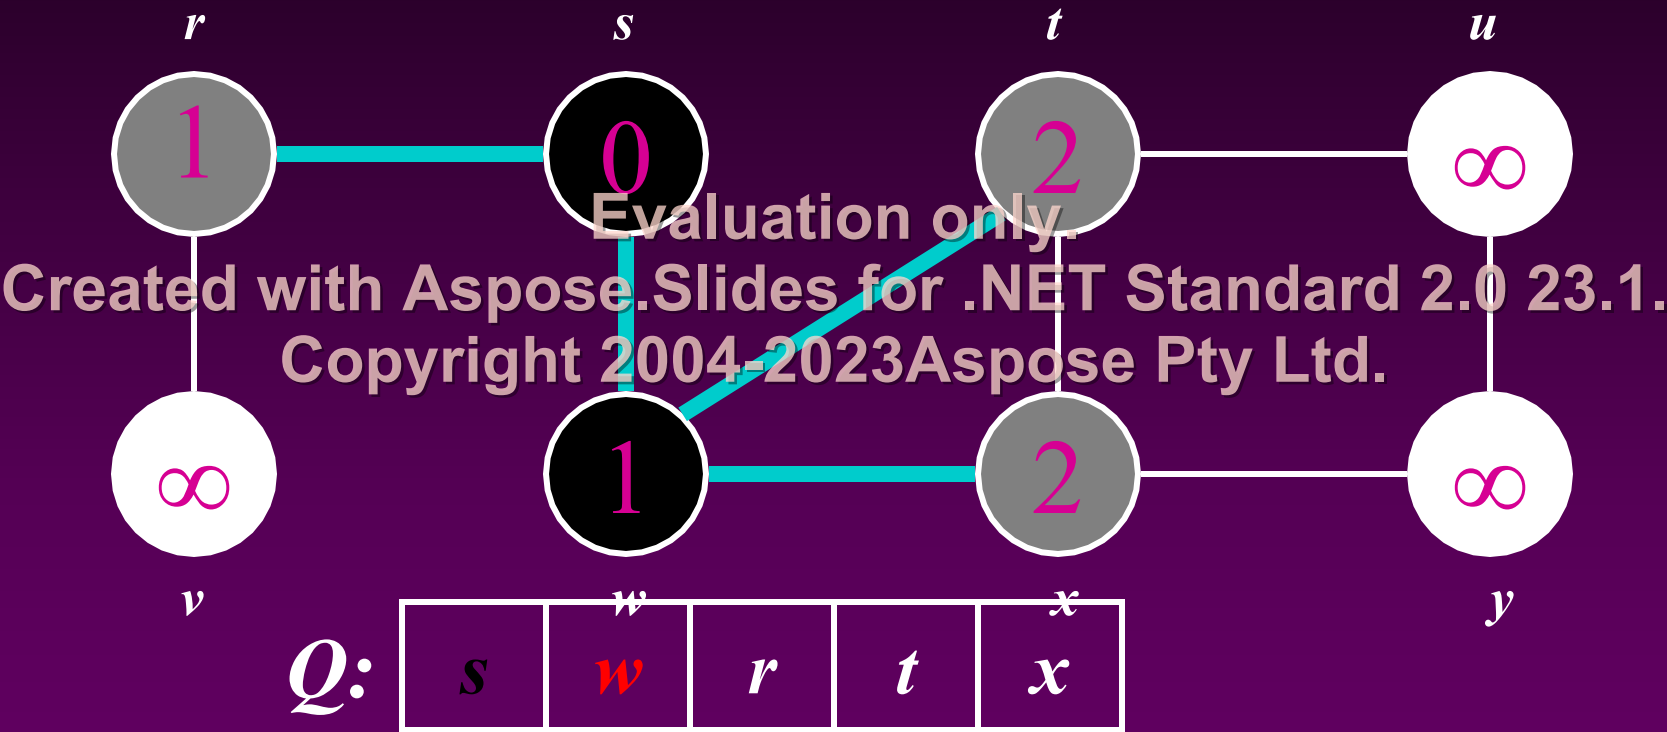

vertex	r	s	t	u	v	w	x	y
Color	W	G	W	W	W	W	W	W
d	∞	0	∞	∞	∞	∞	∞	∞
prev	nil	nil	nil	nil	nil	nil	nil	nil

Breadth-First Search: Example

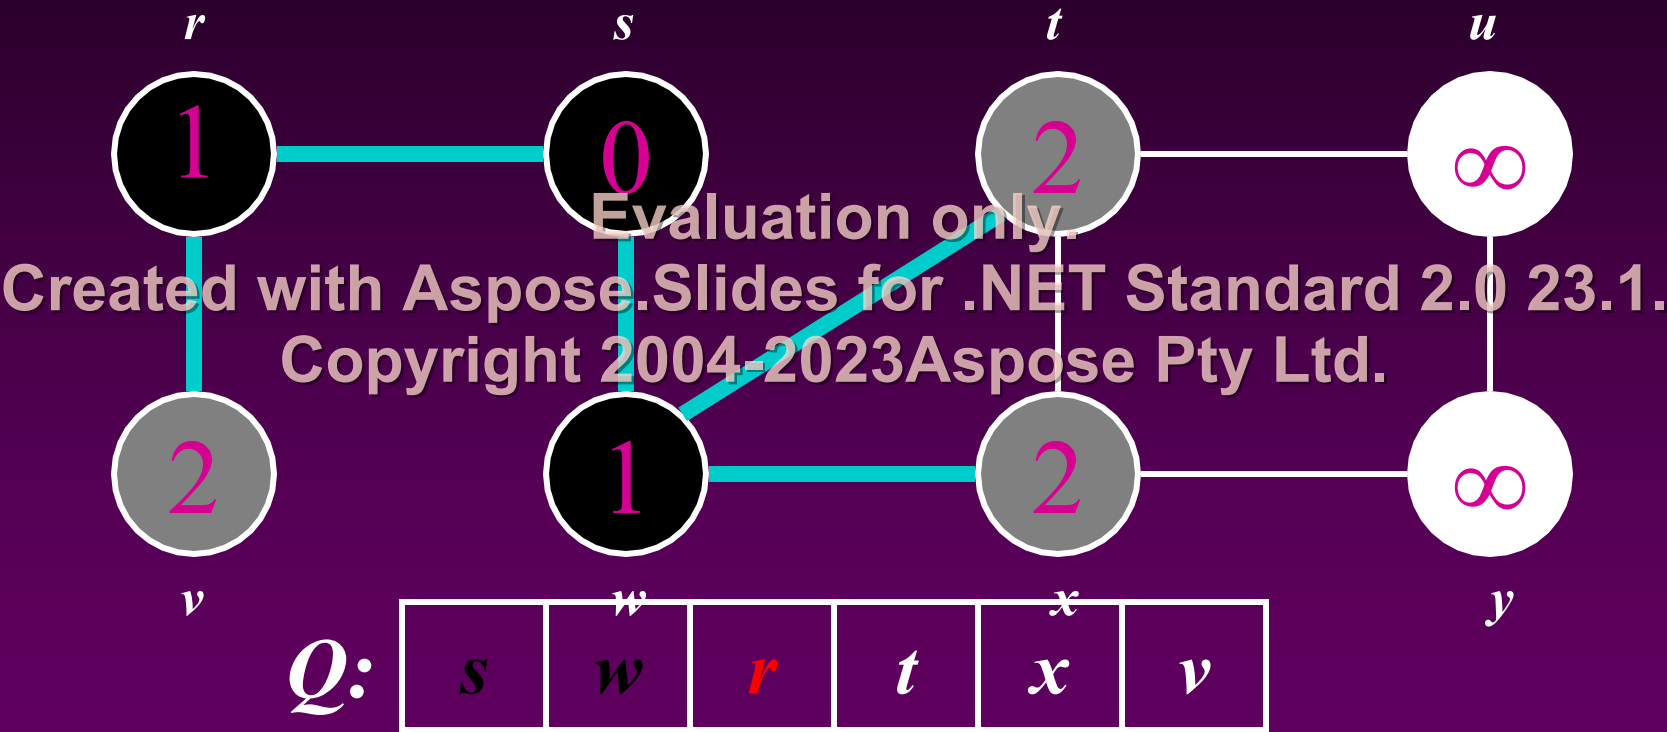

vertex	r	s	t	u	v	w	x	y
Color	G	B	W	W	W	G	W	W
d	1	0	∞	∞	∞	1	∞	∞
prev	s	nil	nil	nil	nil	s	nil	nil

Breadth-First Search: Example

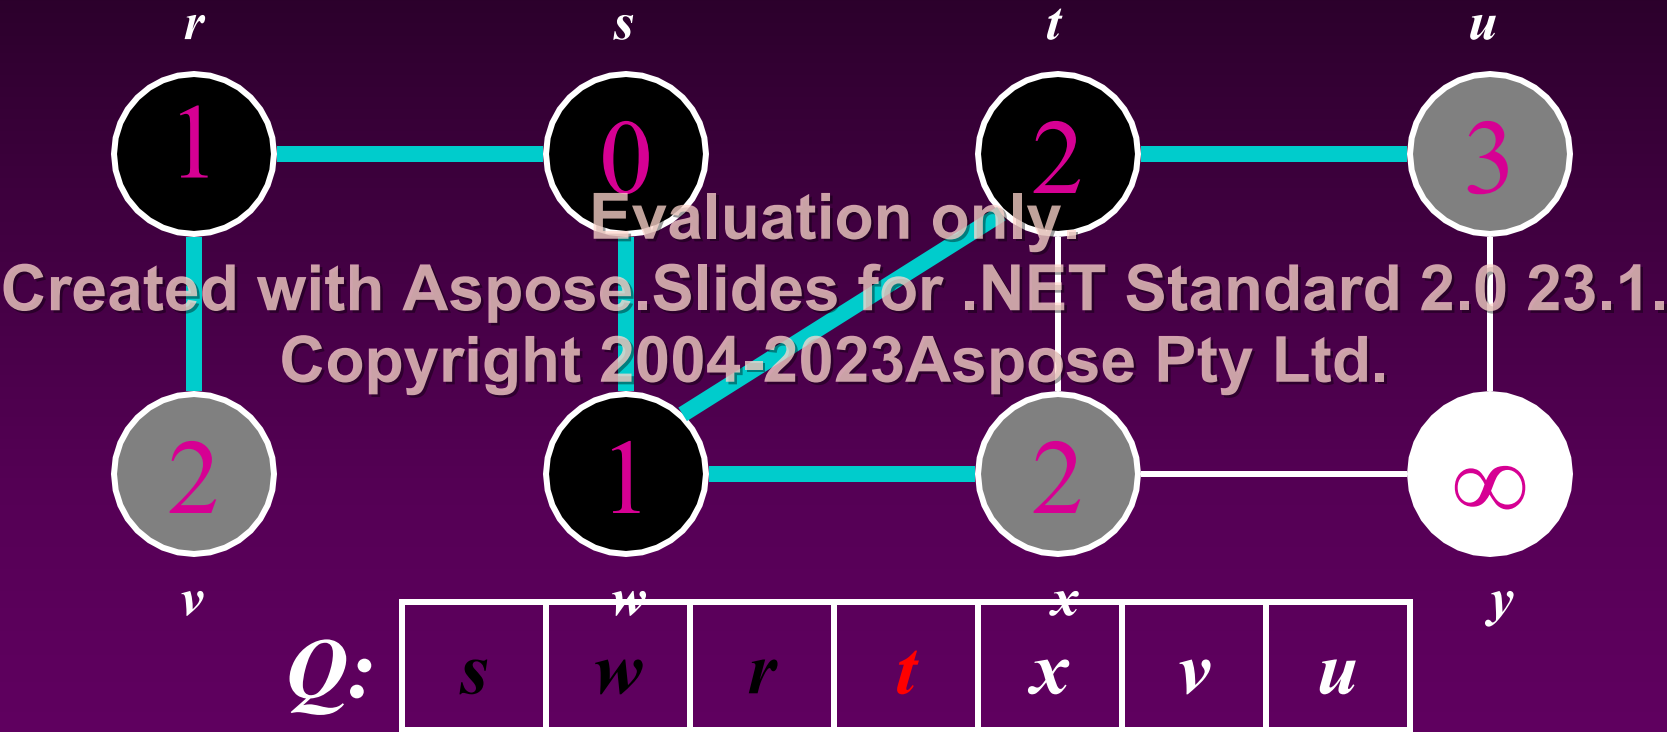

vertex	r	s	t	u	V	w	X	y
Color	G	B	G	W	W	B	G	W
d	1	0	2	∞	∞	1	2	∞
prev	s	nil	w	nil	nil	s	w	nil

Breadth-First Search: Example

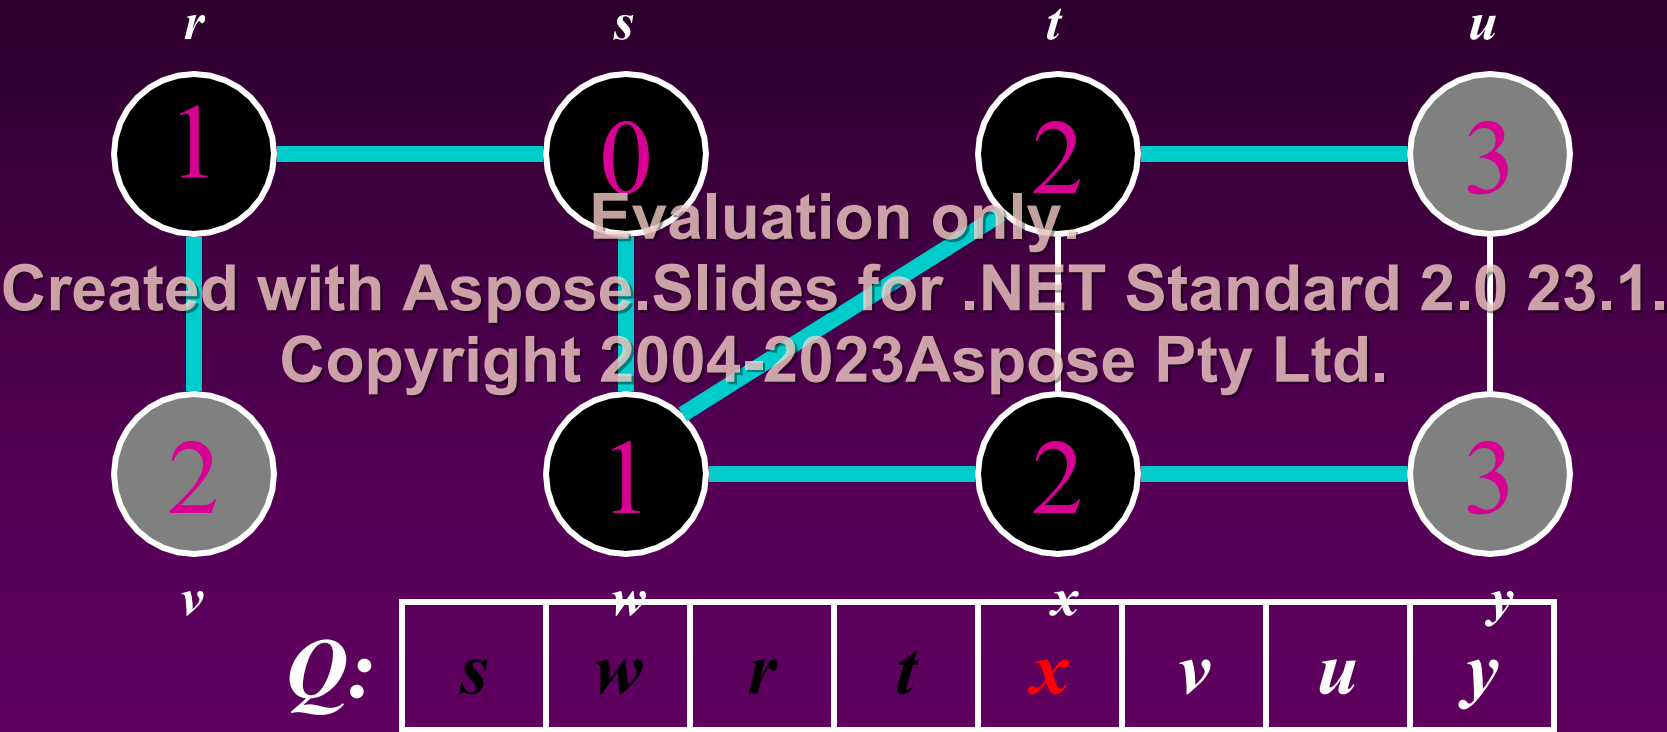

vertex	r	s	t	u	v	w	x	y
Color	B	B	G	W	G	B	G	W
d	1	0	2	∞	2	1	2	∞
prev	s	nil	w	nil	r	s	w	nil

Breadth-First Search: Example

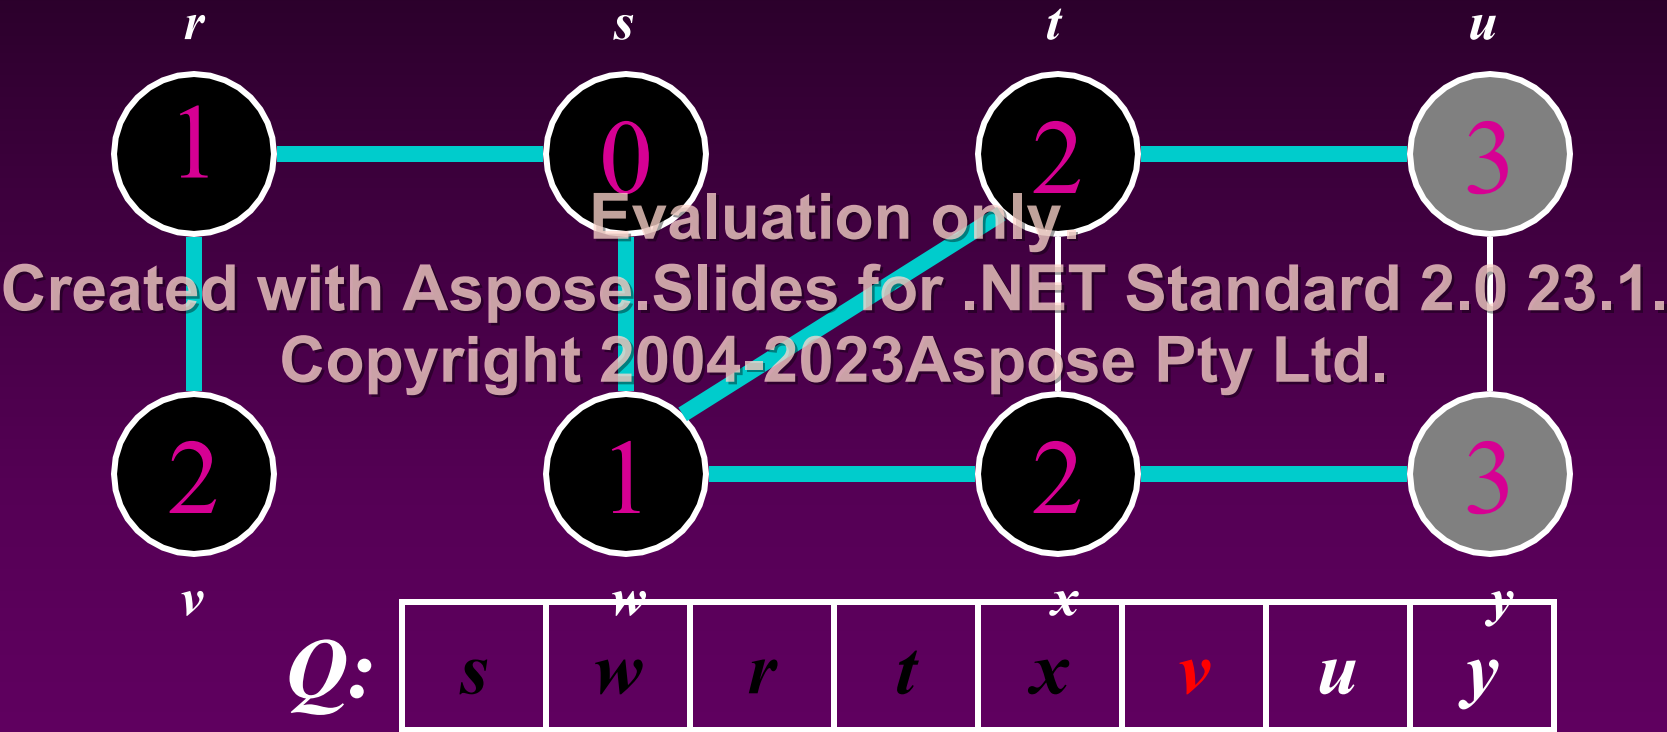

vertex	r	s	t	u	v	w	x	y
Color	B	B	B	G	G	B	G	W
d	1	0	2	3	2	1	2	∞
prev	s	nil	w	t	r	s	w	nil

Breadth-First Search: Example

vertex	r	s	t	u	v	w	x	y
Color	B	B	B	G	G	B	B	G
d	1	0	2	3	2	1	2	3
prev	s	nil	w	t	r	s	w	x

Breadth-First Search: Example

vertex	r	s	t	u	v	w	x	y
Color	B	B	B	G	B	B	B	G
d	1	0	2	3	2	1	2	3
prev	s	nil	w	t	r	s	w	x

Breadth-First Search: Example

vertex	r	s	t	u	v	w	x	y
Color	B	B	B	B	B	B	B	G
d	1	0	2	3	2	1	2	3
prev	s	nil	w	t	r	s	w	x

Breadth-First Search: Example

vertex	r	s	t	u	v	w	x	y
Color	B	B	B	G	B	B	B	B
d	1	0	2	3	2	1	2	3
prev	s	nil	w	t	r	s	w	x

BFS: The Code (again)

Data: color[V], prev[V], d[V]

BFS(G) // starts from here

```
{
  for each vertex  $u \in V - \{s\}$ 
  {
    color[u] = WHITE;
    prev[u] = NIL;
    d[u] = inf;
  }
  color[s] = GRAY;
  d[s] = 0; prev[s] = NIL;
  Q = empty;
  ENQUEUE(Q, s);
```

```
  While(Q not empty)
  {
    u = DEQUEUE(Q);
    for each  $v \in \text{adj}[u]$ 
    {
      if (color[v] == WHITE)
      {
        color[v] = GRAY;
        d[v] = d[u] + 1;
        prev[v] = u;
        Enqueue(Q, v);
      }
    }
    color[u] = BLACK;
  }
}
```

Breadth-First Search: Print Path

Data: color[V], prev[V], d[V]

```
Print-Path(G, s, v)
```

```
{
```

```
    if (v==s)
```

```
        print(s)
```

```
    else if (prev[v]==NIL)
```

```
        print(No path);
```

```
    else{
```

```
        Print-Path(G, s, prev[v]);
```

```
        print(v);
```

```
    }
```

```
}
```

Evaluation only.

BFS: Complexity

Data: color[V], prev[V], d[V]

BFS(G) // starts from here

```
{
  for each vertex u ∈ V - {s}
  {
    color[u] = WHITE;
    prev[u] = NIL;
    d[u] = inf;
  }
  color[s] = GRAY;
  d[s] = 0; prev[s] = NIL;
  Q = empty;
  ENQUEUE(Q, s);
```

While(Q not empty)

```
{
  u = DEQUEUE(Q);
  for each v ∈ adj[u]{
    if(color[v] == WHITE){
      color[v] = GREY;
      d[v] = d[u] + 1;
      prev[v] = u;
      Enqueue(Q, v);
    }
  }
  color[u] = BLACK;
}
```

Evaluation only.

What will be the running time?

³⁹ Total running time: $O(V+E)$

Breadth-First Search: Properties

- ✉ BFS calculates the *shortest-path distance* to the source node
 - Shortest-path distance $\delta(s, v)$ = minimum number of edges from s to v , or ∞ if v not reachable from s
 - Proof given in the book (p.472-5)
- ✉ BFS builds *breadth-first tree*, in which paths to root represent shortest paths in G
 - Thus can use BFS to calculate shortest path from one vertex to another in $O(V+E)$ time

Application of BFS

✉ Find the shortest path in an undirected/directed unweighted graph.

✉ Find the bipartiteness of a graph.

✉ Find cycle in a graph.

✉ Find the connectedness of a graph.

Evaluation only.

Created with Aspose.Slides for .NET Standard 2.0 23.1.
